

## Main Idea: (MVP)

- ① make a Wiki-type app for families + teachers (or anyone) learning about individuals with special needs.
- ② Provide thorough, searchable list of terms + keywords
- ③ Allow user to search, narrow results, and choose their desired "index card".
- ④ Once clicked, the index card toggles (?) and shows relevant info.

REACT NATIVE

## Stretch Goals:

- ① Add 100+ terms so this is <sup>sorta</sup> viable in usage.
- ② Add a "get help near me" button that brings up a google map of local professionals within a certain ~~to~~ radius.
- ③ Other links to donate to Autism Speaks, Special Olympics, etc.

## Behavior Buddy

What should we learn about today?

Resources: ~ ~ ~

Adjuvative Behavior

## Questions:

- ① How do I connect this to, and utilize, a database with React Native?
- ② A lot of tutorials show things set up differently than what I have... should I pivot and try to copy ~~the~~ more closely the tutorials? Or try to work what I have?
